Sacramento Valley water suppliers are committed to the development of a comprehensive plan for the management of water resources that satisfies the co-equal goals of water supply reliability and ecosystem benefits. A priority for that plan is improving habitat for fish and birds, which is best achieved by providing functional and targeted flows that are directly tailored for specific purposes and benefits. This includes existing instream flow arrangements for salmon, as well as spreading water out and slowing it down over the Sacramento Valley landscape for both economic purposes and for returning fish and birds to habitats that more closely match their natural history. This will ultimately benefit the Sacramento Valley and the Delta.

Leaders in the region are making a concerted effort to re-establish the natural connection between water and the landscape. The following are examples of how functional flows that are purposely designed to benefit fish and birds have worked:

**Birds**

Water is spread throughout the region for ricelands and other farms, managed wetlands and wildlife refuges. These areas not only serve as the economic engine for the region, but also as a resting and food source for birds, garter snakes and other water-dependent species along the Pacific Flyway. These managed lands help compensate for the 95 percent of Central Valley wetlands lost over the years.

**Salmon**

Over the past decade flows have been re-managed on nearly every watercourse in the Sacramento Valley, designed and tailored for the benefit of salmon. This includes pulse flows, which are being further explored to benefit migrating salmon. Additionally, knowing that food is the primary limiting factor, water managers are advancing a pilot program for producing fish food on farmland by gently inundating lands within the traditional flood plain then returning the food-rich waters to the rivers at a time when it most benefits migrating juvenile salmon.

**Delta Smelt**

Water suppliers worked with state and federal agencies in 2016 to re-route flows through the Colusa Drain and Yolo Bypass to provide the optimal conditions to create plankton, the critical food source for growing Delta smelt. Initial monitoring indicated that the strategy was effective in boosting downstream food resources for smelt, which could improve ecosystem conditions so more young Delta smelt survive and reproduce.
The Sacramento Valley is a unique landscape where additional opportunities exist to use functional flows to further these benefits. The features of the Sacramento Valley landscape present exciting possibilities to re-establish the magical connection between water and landscape through functional flows.

**Bypasses & Parkways**
The Sacramento Valley has an ingenious system of bypasses and parkways that move water through the region during floods to protect the Sacramento Metropolitan area and rural communities. Strategically inundating the bypasses and parkways with shallow water shows great promise to provide a rich food source for fish and other species that mimics the natural processes in the Sacramento Valley.

**Farmland & Refuges**
Water is critical for two million acres of farmland, seven federal wildlife refuges, and more than 50 state wildlife areas. Farms and wildlife areas not only serve as the economic and cultural engine in the Sacramento Valley, but can be further used to provide important food for birds and fish through innovative water management.

**Aquifer Recharge**
The Sacramento Valley is a flow-through system, where water not used by crops and wetlands returns to the river or percolates down to recharge valley aquifers, for use at a later time.

**Offstream Storage**
Proposition 1 (Chapter 8) has $2.7B for statewide system improvements that include environmental blocks of water. Water can be saved during wet periods in Sites Reservoir, a proposed off-stream reservoir on the west-side of the Sacramento Valley, to then provide more than 200,000 acre-feet of water dedicated to public benefits, including flows for the environment.

**Delta Flows**
The Sacramento Valley functions as a funnel, where more than 24 percent of managed water runs through the bottom of the funnel and is dedicated to Delta outflow under Biological Opinions and State Water Board decisions. This outflow has been increased by more than 1.3 million acre-feet of water during the past decade.

Partnerships between Sacramento Valley water suppliers, federal and state agencies, and solution-oriented conservation organizations have led to tremendous progress on projects that have had a positive impact on fish and other wildlife, yet more work is ahead.

**Continuing to develop voluntary agreements, consistent with a functional flow approach, will ensure that this important work in the Sacramento Valley will benefit fish and wildlife.**
